# 1 Project Overview

The Witcher Tracker is an inventory-event management system that simulates Geralt's interactions in the Witcher universe. The system is implemented in C++ using Object-Oriented Programming and handles commands related to looting, brewing potions, learning monster weaknesses, and querying Geralt's inventory, bestiary, and alchemy formulas.

## 2 Design and Implementation

### 2.1 Class and Object Design

- **Inventory:** Manages ingredients, potions, and trophies.
- **Bestiary:** Stores knowledge about monsters and their effective counters.
- **Alchemy:** Maintains potion recipes and handles brewing logic.

### 2.2 Execution Flow

1. The program reads a line of input prefixed with >>.
2. The line is passed to the parser, which identifies the command type.
3. The appropriate handler is called, and the result is printed.

## 3 Challenges and Solutions

- **Flexible input parsing:** Regex patterns were carefully constructed to allow varying whitespace but disallow invalid characters or structure.
- **Input sanitization:** We had to trim and normalize input for accurate parsing and validation.

## 4 Usage Guide

### 4.1 Compilation

To compile the program:

```
make
```

This will generate an executable named `witchertracker`.

### 4.2 Execution

To run the program:

```
./witchertracker
```

### 4.3 Example Inputs and Outputs

```
>> Geralt loots 4 Vitriol, 3 Rebis  
Alchemy ingredients obtained
```

```
>> Geralt learns Igni sign is effective against Harpy  
New bestiary entry added: Harpy
```

```
>> Geralt encounters a Harpy  
Geralt defeats Harpy
```

```
>> Total ingredient ?  
3 Rebis, 4 Vitriol
```

```
>> What is in Black Blood ?  
3 Vitriol, 2 Rebis, 1 Quebrith
```

## 5 Code Structure Summary

- `main.cpp`: Entry point
- `WitcherTracker.h/.cpp`: Main class that holds inventory, bestiary, and alchemy objects.
- `Inventory.h/.cpp`: Manages adding/removing/querying ingredients, potions, and trophies.
- `Bestiary.h/.cpp`: Manages effective signs and potions against monsters.
- `Alchemy.h/.cpp`: Manages potion recipes and brewing logic.

## 6 AI Assistant Usage

ChatGPT was used for:

- Suggesting regex patterns for flexible yet strict grammar validation.
- Debugging segmentation faults in input parsing stages.
